

# Focus on Alzheimer's

**Dementia is a generic term used to describe a set of symptoms, including memory loss and changes to behaviour, as the result of progressive and irreversible neurodegenerative diseases.**

Alzheimer's disease is the most common cause of dementia, characterized by senile plaques, neurofibrillary tangles and neuroinflammation. Plaques form within the brain when amyloid precursor proteins are cleaved, and A $\beta$  (amyloid beta) peptide accumulates outside nerve cells. Tangles occur inside nerve cells, when tau protein is hyperphosphorylated, forming abnormal paired strands, thereby destroying a vital cell transport system. Neuroinflammation mediated by glial cells, has been identified as a component in the neurodegeneration caused by Alzheimer's disease. However, further research is still needed to fully understand the inflammatory processes.
